

It's a scary world

But your child doesn't have to live in a bubble.

Whooping cough can be deadly, but there's a vaccine to keep your child safe.

Childhood vaccinations help protect your child from contracting 14 childhood diseases that could be life-threatening.

Most vaccines should be administered by age 2.

Both boys and girls ages 11 or 12 should receive the HPV vaccine.

Babies should see the doctor six or more times until they're 15 months old.

There are still cases of the measles in the United States. The vaccine can prevent both the disease and its complications.

Get your child vaccinated!
